

REQUIREMENTS FOR THE CREATION OF NEW PEDAGOGICAL TECHNOLOGIES IN EDUCATION OF YOUTH STUDENTS

Dosmatov Togonboy Ganievich

QDPI, Teacher of the Department of Technological Education

ANNOTATION

In this article, the requirements for the creation of new pedagogical technologies in providing education to young students, the development of society, and the achievement of the intended educational result were highlighted.

Keywords: Society has developed, increasing the efficiency of student time, Modern pedagogical technologies.

On the basis of the words of the President of the Republic of Uzbekistan Sh.M. Mirziyoev: "We consider it our first priority to improve the activities of all links of the education and training system based on the requirements of today's times" lies

As society developed, many new sciences began to appear. In our republic, the great work towards building an independent legal, democratic state, and a free civil society will help to rediscover the essence of human consciousness, realize the possibilities of self-realization, and create new conditions for spiritual and intellectual development.

The introduction of the concept of "new pedagogic technology" opened the way to completely new approaches to the educational process. A set of specific, scientifically based teaching and training methods aimed at achieving specific, realistically achievable educational, educational and developmental goals and their implementation is a new pedagogical technology.

The analysis of the international experience of reforming the educational system shows that the direction of describing the concept of "New Pedagogical Technology" as universal and all-encompassing is becoming more and more widespread. New pedagogical technology is a systematic method of determining the entire process of teaching and learning, taking into account technical and human resources and their interaction, which sets itself the task of optimizing educational forms.

It is known that the main quality indicators of modern pedagogical technology in terms of DTS requirements are the following:

- ensuring the achievement of the educational level specified in the state educational standard;
- ensuring the effectiveness of achieving the intended educational result;
- to increase the efficiency of the student's time, to ensure the "economy" and optimality of pedagogical power, enthusiasm and didactic means of education.

Goal-oriented development of modern pedagogical technologies, based on the optimal implementation of their indicators, methodical system, that is, the organization of the educational process, forms of student activity, professional pedagogical skills of the teacher, management of the educational process, diagnosis, stipulates that reform is necessary.

Today, a teacher with modern knowledge needs to be searched a lot so that he can use his skills and deliver all his knowledge to the student. That is, changing the process both in terms of content and form, which should be oriented towards perfect human education, is an urgent task.

Changing teacher-student positions in the course of the lesson, i.e. giving up the absolute authority of the teacher, allowing the student to think independently, and developing methods aimed at bringing him to the level of assimilation, comparison, analysis and implementation of the information given on each topic, has become the demand of the day.

If the interests and rights of the people are primarily guaranteed, and if this is given importance in practice and its implementation is ensured, this will fully ensure the enthusiastic work of the people and their activity in the work of strengthening independence. This is the main task of the legal democratic state we are building. Already, "Uzbekistan, declaring its independence, has stepped into the era of restoring its moral and intellectual potential, making fundamental changes in the economic and social spheres, and building the foundation of a legal democratic state with social protection in mind." What is guaranteed in the constitution and other laws, they are able to educate the people as well as the younger generation in this spirit.

Among the current issues, the President put education as one of the priorities after politics, state building and economy, and defined its purpose and measures to achieve it. In particular, the President addressed the first issue in the field of education: "Restoring our national values, realizing our identity, forming a national idea and ideology, restoring the place and respect of our holy religion and our spiritual life, consistently continuing our good works that began in the years of independence, raising them to a new level, is to strengthen the zaden break." These instructions of the President serve as a general methodological basis for those working in the social sphere, including those engaged in education.

The main goal of the people of the Republic of Uzbekistan is the establishment of a legal democratic state and the formation of a just civil society. The general goal of the education sector is to educate people who meet the requirements of a legal democratic state and a just civil society. The research conducted since the year of independence shows that the state and society of Uzbekistan are making the following demands on the education workers: - in the process of social reforms, to identify the defects inherited from the totalitarian system in education and to look for ways not to carry them into the new century;

- creation of national pedagogical foundations of science education;
- studying pedagogical technologies widely used in world educational practice and introducing them into the national education system;
- to find modern ways of arming young people with the theoretical foundations of didactic and social psychology, as well as methods of acquiring the inner knowledge of Sufism, in order to increase the cognitive activity of young people;
- to increase the leadership role of the foundations of spirituality in order to use national and universal personnel in the teaching of social sciences;
- determination of the character and qualities of the national personality during the educational process;
- formation of national pride in the young generation by studying national heritage in depth and communicating it to young people.

The President said: "We are facing new great tasks, our task with you is to give a worthy response to all the demands of the times."

It is clear from this that it is necessary to improve educational work, to enrich and ensure the continuity of the content of knowledge given to young people, and to create new advanced pedagogical technologies.
